

Duracel

The planet Duracel, located within the Inner Planets, is one of the major energy exporters to the galaxy. The planet is covered in Savanahs and some small mountainous regions as well as rivers and oceans. Hydro-electric, nuclear, and just about every other 'clean' type of energy generating station can be found all over the planet. Small cities are built around the clusters of generator stations. From orbit these look like circular patches with long grey lines streaking out from them irregularly(roads). These cities are pwoer by a fraction of the generator clusters, and the rest of the enrgy is put into various types of energy cells big and small and exported across the galaxy. Every cluster has at least one large generator at the center that pulls energy from the planet's own reactions while those around it use various other means. The rest of the planet is prstine and open for tourists and people just wanting to get away from it all.

Type: Terrestrial

Temperature: Temperate

Atmosphere: Type I

Hydrosphere: Moderate

Gravity: Standard

Terrain: Savanah, Mountains

Length of Day: 35 standard hours

Length of Year: 396 local days

Planet Function: Energy

Starport: Imperial class

Population: 600,000

Government: Corporation

Tech Level: Space

Major Exports: Energy, Tourism

Major Imports: Foodstuffs
